Git Branching Protocol

- master branch will be used for production. This is where we will number our version. Currently at 0.0. Nobody will touch this branch expect for Tyler.

- development branch will be used for developing (surprise). This is the branch where all of our branches will be merged once they are complete.

- From here, we get into our own development branches. Each is prefaced with a prefix based on our names followed by a description of the feature we will be tackling. They will all be branched FROM development. I will effectively be the only one touching master branch.

   a. Mindy: mb
   b. Matt: mp
   c. Tyler: tw

- Example for a branch: Matt wants to create a branch that deals with creating four background images adding them to the project. He will select the development branch first, branch off of this and name his branch 'dev/MP/create-four-backgrounds'. This branch will be worked on and when it is completed, Matt will merge the branch back to development*. From here, anyone that wants Matt's changes can simply merge development INTO their own branch- this is accomplished by selecting your branch on GitHub and merging development (Backwards from the first merge process).

*I know merge conflicts are tough. If you have any, let me know and we can Skype call to resolve them.

If you have any questions, let me know.
~Tyler
